This cheat sheet covers a comprehensive set of commands tailored specifically for Red Hat's ecosystem, including package management with YUM and DNF, system services management with systemctl, and user administration commands, among others. Let's dive into this treasure trove of commands that every RHEL user should keep handy.

Basic Navigation and File Management Commands

Before diving into advanced commands, it’s essential to get comfortable with the basics of file and directory management in Red Hat Linux. These commands form the foundation for everyday tasks.

Exploring the Filesystem

- `pwd` – Prints the current working directory. - `ls` – Lists files and directories. Use `ls -l` for detailed info or `ls -a` to include hidden files. - `cd ` – Changes the current directory to the specified one. - `tree` – Displays directory structure in a tree-like format (may require installation). Getting around the filesystem efficiently helps you locate files and understand directory hierarchies quickly.

Handling Files and Directories

- `cp  ` – Copies files or directories. - `mv  ` – Moves or renames files or directories. - `rm ` – Removes files. Use `rm -r ` for directories recursively. - `mkdir ` – Creates a new directory. - `touch ` – Creates an empty file or updates its timestamp. Remember to exercise caution with `rm` since deleting files is irreversible without backups.

Managing Users and Permissions

User management is a core responsibility on Red Hat Linux servers. Here’s a quick rundown of commands to administer users and groups.

User and Group Commands

- `useradd ` – Creates a new user. - `passwd ` – Sets or changes a user’s password. - `usermod -aG  ` – Adds a user to a group. - `groupadd ` – Creates a new group. - `id ` – Displays user and group IDs.

Permissions and Ownership

- `chmod  ` – Changes file permissions (e.g., `chmod 755 file.sh`). - `chown : ` – Changes file ownership. - `ls -l` – Shows file permissions and ownership details. Understanding how to modify permissions and ownership ensures secure access control over files and directories.

Package Management with YUM and DNF

Red Hat Linux uses YUM (Yellowdog Updater Modified) and DNF as its package managers to install, update, and manage software packages. Knowing these commands is critical for

keeping your system up-to-date and installing necessary software.

Installing and Removing Packages

- `yum install ` or `dnf install ` – Installs a package. - `yum remove ` or `dnf remove ` – Uninstalls a package. - `yum update` or `dnf update` – Updates all packages to the latest version. - `yum search ` or `dnf search ` – Searches for packages related to the keyword.

Managing Repositories and Cache

- `yum repolist` or `dnf repolist` – Lists enabled repositories. - `yum clean all` or `dnf clean all` – Cleans the package cache to free disk space. Switching between YUM and DNF is seamless in modern Red Hat systems, but knowing both ensures compatibility across versions.

System Monitoring and Process Management

Keeping an eye on system resources and controlling running processes are everyday tasks for Red Hat Linux administrators.

Viewing System Performance

Process Control

- `ps aux` – Lists all running processes with details. - `kill ` – Terminates a process by its Process ID. - `pkill ` – Kills process(es) by name. - `nice` and `renice` – Adjust process priority. Mastering these commands helps you troubleshoot performance bottlenecks and manage runaway processes effectively.

Systemd and Service Management

Red Hat Linux uses systemd to manage system services and daemons. Controlling services through systemd commands is a daily task in server management.

Managing Services

- `systemctl start ` – Starts a service. - `systemctl stop ` – Stops a service. - `systemctl restart ` – Restarts a service. - `systemctl enable ` – Enables a service to start on boot. - `systemctl status ` – Checks the status of a service. For

example, managing the Apache web server would look like this: systemctl start httpd systemctl enable httpd systemctl status httpd

Checking Boot Targets and Logs

- `systemctl get-default` – Shows the default boot target (runlevel). - `journalctl -xe` – Views detailed system logs, useful for debugging. These commands give you a clear view of your system’s health and boot configuration.

Networking Commands in Red Hat Linux

Managing networking is a key part of administering any Linux system, especially servers that require connectivity.

Checking Network Configuration

- `ip addr` – Displays IP addresses assigned to interfaces. - `nmcli` – NetworkManager command-line tool for managing network connections. - `ping ` – Tests connectivity to a remote host. - `traceroute ` – Traces the route packets take to a host. - `netstat -tulnp` – Shows listening ports and associated programs.

Configuring Network Interfaces

- `nmcli connection show` – Lists all network connections. - `nmcli connection up ` – Brings a connection up. - `nmcli connection down ` – Brings a connection down. Using NetworkManager tools like `nmcli` streamlines network setup and troubleshooting in RHEL.

Disk Management and Storage

Managing storage is critical on Red Hat Linux, especially for servers handling large volumes of data.

Disk Usage and Partitioning

- `df -h` – Shows disk space usage in a human-readable format. - `du -sh ` – Displays the size of a directory. - `fdisk -l` – Lists disk partitions. - `lsblk` – Shows block devices in a tree-like format.

Mounting and Unmounting Filesystems

- `mount  ` – Mounts a filesystem. - `umount ` – Unmounts a filesystem. These commands help you keep track of your storage devices and manage partitions effectively.

File Searching and Text Processing

Working effortlessly with files involves searching and processing text quickly.

Searching Files and Directories

- `find /path -name ` – Finds files by name. - `grep 'pattern' ` – Searches for a pattern in files. - `locate ` – Quickly finds files using a database (requires `mlocate`).

Editing and Viewing Files

- `cat ` – Displays the file content. - `less ` – Views files page by page. - `nano ` or `vi ` – Opens a file in a text editor. Combining commands like grep and find can make searching for specific content very efficient.

A Red Hat Linux Commands Cheat Sheet PDF ensures that text alignment, fonts, images, colors, charts, and layouts remain exactly as intended by the creator.
